PA99 • PA99A

## Power Operational Amplifier

## FEATURES

- Up to $2400 V_{\text {p-p }}$ Output
- Wide Supply Range $- \pm 100 \mathrm{~V}$ to $\pm 1250 \mathrm{~V}$
- Programmable Current Limit
- 50 mA Continuous Output
- Hermetically Sealed Package
- Temperature Sensor

## APPLICATIONS

- Semiconductor Testing
- Piezo Positioning
- High Voltage Instrumentation
- Electrostatic Deflection

## DESCRIPTION

The PA99 is an ultra-high 2,500 V power operational amplifier designed for output currents up to 50 mA to target high voltage applications including piezoelectric positioning, instrumentation, semiconductor production testing, and electrostatic deflection. Output voltages can swing up to $2,400 \mathrm{~V}_{\text {p-p }}$.

High accuracy for this MOSFET power amplifier is achieved with a cascode input circuit configuration. External compensation provides user flexibility by allowing customers to tailor slew rate and bandwidth performance. A resistor configurable current limit provides system level protection.

## TYPICAL CONNECTION

Figure 1: Typical Connection

## PINOUT AND DESCRIPTION TABLE

Figure 2: External Connections

| 1 | NC |  | + IN |
| :--- | :--- | :--- | :--- | 12

| Pin Number | Name | Description |
| :---: | :---: | :---: |
| 1,2 | NC | No connection. |
| 3 | -CL | Connect a negative current limit resistor between this pin and -Vs pin. |
| 4 | - Vs | The negative supply rail. |
| 5 | CC | Connect a compensation capacitor between this pin and +CL pin. The compensation <br> capacitor needs to be rated for at least the maximum supply voltage. |
| 6 | +CL | Connect a positive current limit resistor between this pin and the OUT pin. Output <br> current flows out of this pin through $\mathrm{R}_{\text {CL+ }}$. |
| 7 | OUT | The output. Connect this pin to load and to the feedback resistors. |
| 8 | TEMPA | The anode for the temperature sensing diode. |
| 9 | TVMPB | The cathode for the temperature sensing diode. |
| 10 | -IN | The positive supply rail. |
| 11 | +IN | The inverting input. |
| 12 |  | Then-inverting input. |

## PA99 • PA99A

## SPECIFICATIONS

Unless noted otherwise, the test conditions are as follows: $T_{C}=25^{\circ} \mathrm{C}, \Delta \mathrm{V}_{\mathrm{S}}=2000 \mathrm{~V}, \mathrm{R}_{\mathrm{L}}=50 \mathrm{k} \Omega, \mathrm{A}_{\mathrm{V}}=100, \mathrm{R}_{\mathrm{F}}=$ $200 \mathrm{k} \Omega, \mathrm{C}_{C}=15 \mathrm{pF}$. DC input specifications are value given. The power supply voltage is typical rating.

ABSOLUTE MAXIMUM RATINGS

| Parameter | PA99 \& PA99A |  | Unit |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Symbol | Min |  |  |
| Supply Voltage | ${ }^{2} \mathrm{~V}_{\mathrm{S}}$ to $-\mathrm{V}_{\mathrm{S}}$ |  | 2500 | V |
| Output Current, Peak, within SOA | $\mathrm{I}_{\mathrm{O}}$ |  | $\pm 70$ | mA |
| Power Dissipation, internal, DC | $\mathrm{P}_{\mathrm{D}}$ |  | 37 | W |
| Input Voltage, common mode | $\mathrm{V}_{\mathrm{cm}}$ |  | $-\mathrm{V}_{\mathrm{S}}+50$ to $+\mathrm{V}_{\mathrm{S}}-50$ | V |
| Input Voltage, differential | $\mathrm{V}_{\mathrm{IN}}($ Diff $)$ |  | $\pm 20$ | V |
| Temperature, pin solder, 10s |  |  | +225 | ${ }^{\circ} \mathrm{C}$ |
| Temperature, junction ${ }^{1}$ | $\mathrm{~T}_{\mathrm{J}}$ |  | +150 | ${ }^{\circ} \mathrm{C}$ |
| Temperature, storage |  | -40 | +150 | ${ }^{\circ} \mathrm{C}$ |
| Operating Temperature Range, case | $\mathrm{T}_{\mathrm{C}}$ | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |

1. Long term operation at the maximum junction temperature will result in reduced product life. Derate internal power dissipation to achieve high MTTF.

INPUT

| Parameter | Test Conditions | PA99 |  |  | PA99A |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## TYPICAL APPLICATION

Figure 20: Typical Application Circuit

Figure 20 shows PA99 in a typical inverting amplifier circuit. The resistors $\mathrm{R}_{\text {LIM }+}$ and $\mathrm{R}_{\text {LIM- }}$ are used to limit the current output. If no current limit is desired, a direct connection between $\mathrm{C}_{\mathrm{L}}+$ and OUT is required for proper operation, and $\mathrm{C}_{\mathrm{L}}$ - must be connected to $-\mathrm{V}_{\mathrm{S}}$ with a resistor larger or equal $200 \mathrm{k} \Omega$ in that case.

## OUTPUT CURRENT AND DEVICE COOLING

PA99 can handle output currents of $\pm 50 \mathrm{~mA}$, but careful considerations need to be done about proper cooling of the device to avoid damage due to overheating. When calculating the power loss inside the device, the output current and the quiescent currents need to be considered.

For example, if the device uses a supply voltage of 1000 V , the output voltage to a resistive load is 500 V and the output current is 50 mA , the power loss inside the device is calculated as follows:

$$
P_{\text {DEVICE }}=(1000 \mathrm{~V}-500 \mathrm{~V}) \cdot(50+4) \mathrm{mA}=27 \mathrm{~W}
$$

In the above example, the device will dissipate 27 W of heat. If we supply 1500 V instead of 1000 V , the power dissipation of the device doubles, resulting in a loss of 54 W .

As alternative to extensive device cooling, it should be considered to alter the supply voltage of the device. If the PA99 is used in a test environment where is needs to drive 50 mA at 500 V but 5 mA at 2000 V , consider supplying two voltages, i.e. 1000 V and 2500 V , and provide for sufficient cooling for the approximate 30 W of power dissipation of the device.

## OVERVOLTAGE PROTECTION

Although the PA99 can withstand differential input voltages up to $\pm 20 \mathrm{~V}$, additional external protection is recommended. In most applications 1 N 4148 signal diodes connected anti-parallel across the input pins are sufficient. In more demanding applications where bias current is important diode connected JFETs such as 2 N 4416 will be required. In either case the differential input voltage will be clamped to $\pm 0.7 \mathrm{~V}$. This is usually sufficient overdrive to produce the maximum power bandwidth.

## CURRENT LIMIT

PA99 allows independent setting of a positive and negative current limit.

## POSITIVE CURRENT LIMIT

The resistor value $R_{\text {LIM }+}$ for positive current limit is calculated as follows:

$$
R_{L I M}(\Omega)=\frac{0.65 \mathrm{~V}}{I_{L I M}(A)}
$$

| Positive Current Limit | Measured Resistor Value (R $\mathbf{R}_{\text {LIM }+\boldsymbol{+}}$ ) |
| :---: | :---: |
| 5 mA | $130 \Omega$ |
| 10 mA | $68 \Omega$ |
| 20 mA | $32.4 \Omega$ |
| 40 mA | $15.8 \Omega$ |

## NEGATIVE CURRENT LIMIT

The current limit resistor for the negative current limit can be approximated as:

$$
R_{L I M}(\Omega)=5324 \times e^{76.4 \times I_{L L M}}(A)
$$

| Negative Current Limit | Measured Resistor Value (R |
| :---: | :---: |
| LIM-) |  |
| 5 mA | $8 \mathrm{k} \Omega$ |
| 10 mA | $15 \mathrm{k} \Omega$ |
| 20 mA | $33 \mathrm{k} \Omega$ |
| 40 mA | $92 \mathrm{k} \Omega$ |

## TEMPERATURE SENSING

The temperature sensing pins of the PA99 are connected to a 1N4448 type of diode that can be used to sense the temperature inside the device. A typical application will use a current source as the best means for the excitation of the diode.

## PACKAGE OPTIONS

| Part Number | Apex Package Style | Description |
| :---: | :---: | :---: |
| PA99 | CW | 12-pin Power DIP, High Voltage |
| PA99A | CW | 12-pin Power DIP, High Voltage |

## PACKAGE STYLE CW
